

## Abstract of the Disclosure

An apparatus for the purpose of securing fish after catch with a tip with cord attachment positioned for the purpose of allowing piercing and or passage through fish lip or gill while subsequently forbidding the tip to come back through the passage without assistance of user. In the preferred embodiment the cord is attached to a rigid tip in any other position than either extreme end. This unique positioning of fixation of cord to tip allows tip, after passed through narrow opening in fish, to be prevented to reverse passage through opening, unless assisted, thereby retaining fish on stringer from the moment loaded. The preferred embodiment also allows user to load fish without ever having to remove stringer from fixed anchor position thereby preventing loss of entire stringer. In addition, the preferred embodiment allows user easy access to tip thereby user may load fish with a one hand operation.
